

CSS

- Cascading StyleSheet
- To make the html pages attractive

Adding the css

- we can add the css in 3 ways
1. Inline
 2. Internal
 3. External

CSS Rule

selector + declaration block

```
div{  
    // declarations  
    // css property : value  
}
```

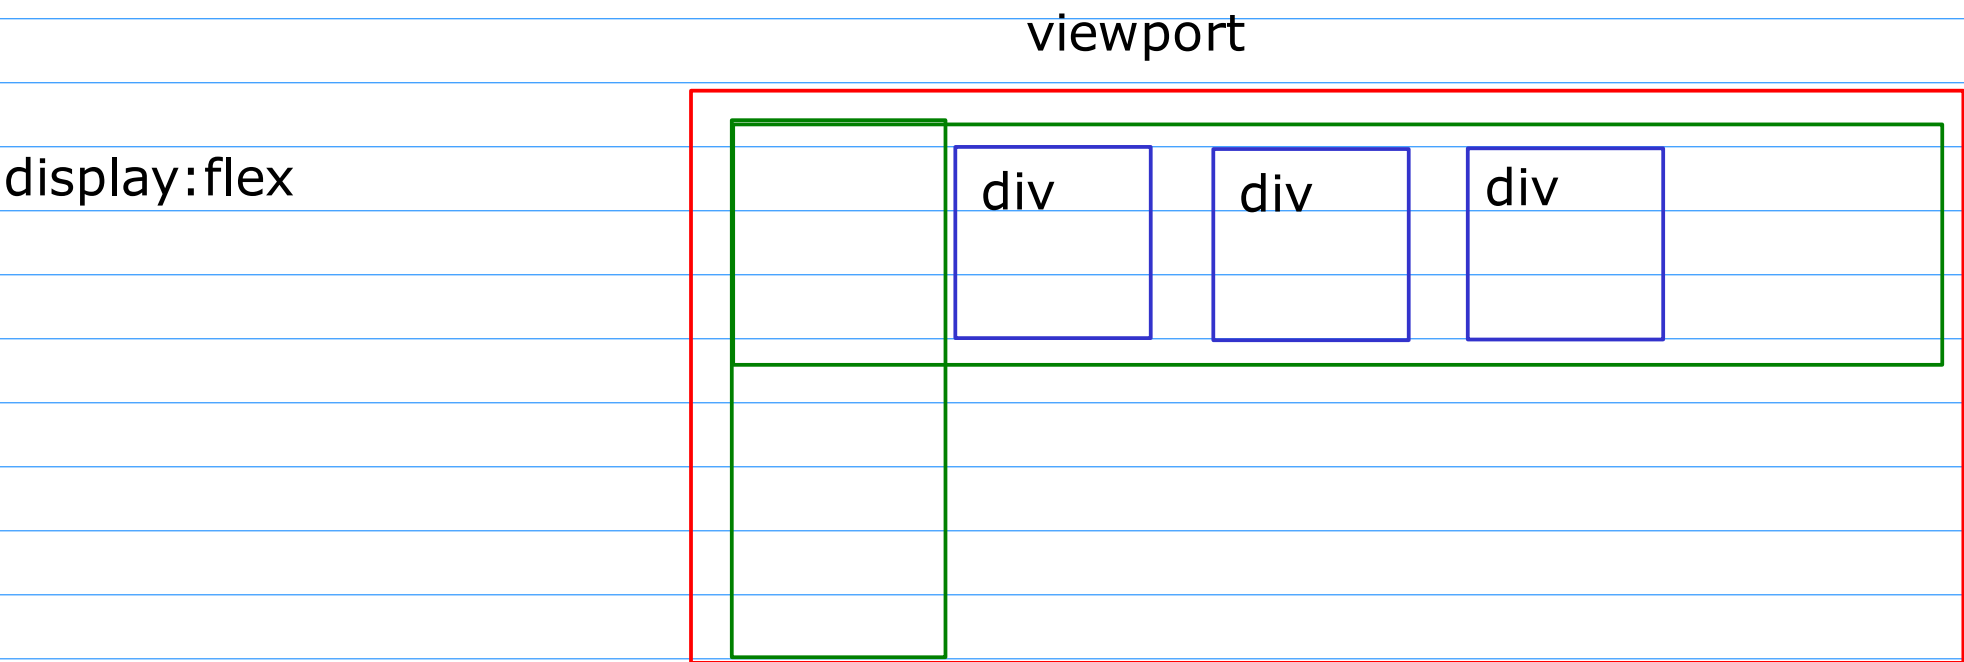

```
div{  
    color : red;  
}
```

Selectors

- | | |
|------------------------------|-------------------|
| 1. Element Selector | div{} |
| 2. Multiple Element Selector | div,p{} |
| 3. Id Selector | #div1{} |
| 4. Class Selector | .c1{} |
| 5. Descendent Selector | div p {} |
| 6. Child Selector | div>p{} |
| 7. Attribute Selector | [type="submit"]{} |
| 8. Pseudo Selectors | div:hover{} |
| 9. universal Selector | * {} |

Positions

1. static -> It ignores top,left,right,bottom
2. relative -> It considers top,left,right and bottom
3. absolute -> will be at the specified position on the view port, if view port is scrolled then the element is scrolled too.
4. fixed -> will be at the specified position on the view port, if view port is scrolled then the element is not scrolled i.e it maintains the position on the screen.

display

- block -> width and height are considered and aligned one below other
- inline -> width and height are not considered and aligned one after other horizontally
- inline-block -> width and height are considered and aligned one after other horizontally
- none -> do not display

- flex

- It is also called as flexiable display
- It must be applied on the container
- Its a one dimensional display
- the elements/contents in the container can be arranged in either row or coloumn
- to align the contents in row or column use the property flex-direction
- within the direction to arrange the contents use the property justify content
