

Components

- These are reusable entities

state

- It is an object that is used to manage the state inside the functional components

React Hooooks

- these are the functions created by react that performs some operations and returns a result
- these functions that are prefixed with 'use' are called as react hooks

useState()

Problem with local variable

- It does not render the page whenever their is change in the value
- To rerender the component when ever the value is changed we have to use the state

Counter c1;

```
class Counter{
  int count = 1

  void setCount(int count){
    this.count = count
  }

  int getCount(){
    return count
  }
}
```

```
const int count = c1.getcount()
c1.setCount(count+1)

const int count = c1.getcount()

void increment(){
  c1.setCount(count+1)
}

void decrement(){
  c1.setCount(count-1)
}
```

function Login(){	function Register(){	function Home(){
}	}	}

pages

function Card(){	function NavBar(){
}	}

components

Navigation

1. static

2. dynamic

}
